Present address: Department of Crop Protection and Seed Technology, Faculty of Agriculture, Moi University, PO Box 1125, Eldoret, Kenya)

Kabuli chickpea (Cicer arietinum L.) gives better financial returns than the desi type. Efforts were made in the past to

develop a medium bold seeded kabuli gram cultivar L 551 at Punjab Agricultural University, Ludhiana, Punjab, India. Over a period of time the old cultivar of kabuli gram L 550 had become susceptible to Ascochyta blight, fusarium wilt, root rot, and foot rot diseases whereas the new cultivar, L 551, possesses high yield potential and resistance to wilt. It is moderately resistant to Ascochyta blight, which is the most destructive disease of the region. This cultivar was developed from the cross ICCC 32 x ICCX 780581-BH-10H-BH, and was attempted at ICRISAT, Patancheru and its F<sub>2</sub> seeds were supplied to PAU, Ludhiana. Pedigree method was used to evolve this cultivar, which was released in 1999 for cultivation throughout the Punjab state except humid areas.

The yield performance of L 551 from 1989 to 1996 in various varietal trials conducted in the state is given in Table 1. The 51 trials comprise of research varietal trials, agronomic trials, adaptive trials, and frontline demonstrations conducted at different locations in the state. The new cultivar gave an average yield of 1901 kg ha<sup>-1</sup> against 1625 kg ha<sup>-1</sup> of control cultivar L 550 and showed 16.9% superiority over the control cultivar. L 551 was also tested in the IVT (kabuli) of All India Coordinated Trials during the postrainy season of 1997-98. On the basis of zonal mean, it had occupied the first position in North West Plain Zone (NWPZ) and the second position in Central Zone (CZ). The new cultivar also performed well on farmer's fields. Demonstrations were conducted at

Table 3. Culinary and nutritional quality of kabuli chickpea cultivars L 551 and L 5501.

|         | 100-seed | Density | Water absorption |           |         | Cooking |
|---------|----------|---------|------------------|-----------|---------|---------|
|         | mass     | 12 h    | 12 h soaking     | Volume    | Protein | time    |
| Variety | (g)      | (%)     | (%)              | expansion | (%)     | (min)   |
| L 551   | 20.2     | 1.27    | 108.4            | 140.7     | 23.18   | 70      |
| L 550   | 21.5     | 1.29    | 104.5            | 146.2     | 23.12   | 75      |

1. Mean over 3 years.

four locations during the postrainy season of 1995-96. L 551 gave a yield of 2056 kg ha $^{-1}$  against 1702 kg ha $^{-1}$  of L 550 (Table 1).

The disease reaction of L 551 and control cultivar L 550 to Ascochyta blight, wilt, foot rot, and root rot from 1989 is given in Table 2. The average Ascochyta blight score of L 551 was 6.3 against 9.0 for L 550. In 6 years,

the incidences of fusarium wilt, foot rot, and root rot were 10.1, 8.2, and 6.6% in L 551 as compared to 41.2, 15.3, and 9.8% in control cultivar L 550, respectively. This means the new cultivar has better resistance to these diseases than the control cultivar. Its culinary and nutritional quality is also good (Table 3). Therefore, the new cultivar offers a better opportunity to the fanners of Punjab.
