Agricultural Extension with Information and Communication Technology (ICT) Mediated Open Distance Learning (ODL) Methods: A Case Study from Rural South India

G. Dileepkumar, Sreenath Dixit, and V. Balaji

Introduction

Drought is increasingly becoming a cause for concern in many regions of South Asia, because recurrent droughts often cause large-scale water and food deficits, hunger, famine, exodus of people and animals, diseases, deaths, and many other severe, chronic socio-economic problems. The degree of vulnerability to the impact of drought varies significantly from one nation to another. Many of the rural communities appear to forget the miseries of one drought season with the onset of good rains; and those miseries usually continue from one drought to the next. This is due to lack of awareness and non-availability of the relevant information. There is an urgent need for sustained information, communication, education and social mobilization among strategic sectors, especially the most vulnerable rural communities and their intermediaries, to improve agriculture and to mitigate the effects of drought. Drought preparedness is preferable to relief, and information is the backbone of drought preparedness (UNSO, 2000).

The Virtual Academy for the Semi-Arid Tropics (VASAT) was initiated in 2002 with a view to leveraging Information and Communication Technologies (ICT) mediated Open Distance Learning (ODL) methods to reach drought information to a large section of communities in a short period of time. Its objective is to create demand-driven content that can be localized to suit the rural communities and their intermediaries, to convert the scientific know-how to field-level do-how. VASAT is a strategic coalition of national and international organizations that deals with information, communication and non-formal distance education. The coalition is led by the International Crops Research Institute for the Semi-Arid Tropics (ICRISAT) and is jointly implemented by the International Livestock Research Institute (ILRI) and the International Water Management Institute (IWMI) and leaders among the national agricultural research systems (Balaji, 2004). In this paper, we report the results of a pilot study on the role of information in enhancing awareness on drought issues. This study was conducted under the VASAT project in South India with a rural partner organization.

A Profile of the Study Area

The Addakal cluster of villages, a highly drought prone area, is a part of Mahabubnagar district located in Andhra Pradesh (AP), India. It has 37 villages, spread over in an area of 19,397 ha; 15% of this area is covered by irrigated land and 60% of the area is rain-fed, and the remaining 25% is considered as ‘waste land.’ The annual rainfall here varies from 391 mm to 542.6 mm. Most of the tube-wells, open wells and tanks in this area are dried up. The literacy rate is 35%. Over 75% workers are engaged in agricultural, dairy farming and allied activities. High risk associated with low investment capacity of farmers often results in higher rate of out migration, school dropouts, food insecurity and poverty (Table 1).

Source: Population census data 2001

The Aadarsha Welfare Society (AWS) located in Addakal is a federation of all-women micro-credit societies. It has a membership of 5,225 rural women (AWS records, 2005 data), and has been functional in all the 37 villages since 1994. AWS accepted VASAT’s invitation to partner a pilot study on the use of information to enhance drought preparedness. The partners in the study have decided to apply a hub-and-spokes model for facilitating information flow into the study area. This model has already been described (Balaji 2000, Punthambekar 2004, Dileepkumar 2005). The hub is generally a set up with reasonable computing facility and Internet access. This is where the value addition to generic information derived from the networks is carried out, and locality-specific information is generated. Trained individuals with college-
level education operate the hub. Rural access points are linked to this hub by telephone. Volunteers at the rural access points receive locality-specific information from the hub and deliver it to rural families in a variety of ways (blackboards, public speakers etc). The hub for VASAT activities is hosted in the AWS building (Figure 1).

From this figure, it emerges that most of the information needs of typical rural resident are met by approaching family members, neighbors or friends (who themselves are not well informed in most cases). At a secondary level, the farm input suppliers; local shops and markets act as important and credible sources of information. Technical information on agriculture, available with a range of agencies is not easy to access by most rural families. This compounds the problem of information poverty in particular. As a first step, we decided to strengthen the access to crop-related information, which is the core of a drought information system.

Process of Information Empowerment

The state Agricultural Officer (AO) is a pivot in the agricultural extension system and acts like a mediator between the farmers and the experts. It is a difficult task for an individual to provide solutions to the 37 villages at the same time. After several interactions in the three villages, we observed that the farming communities in these villages were not getting timely information for their farm related problems. VASAT introduced a Question and Answer (Q & A) service in the VICs and the hub acted as a central station for these activities. The VICs are open to everyone, irrespective of age, sex, religion, caste and level of literacy and education. The VNAs and the local volunteers distributed the pamphlets in Telugu (local language) about the availability of agro advisory service at the VIC. No predefined methodology was available to start this.

We agreed to provide traveling allowances to two Para Extension Workers (PEW) of AWS for operating this service. ICRISAT experts agreed to answer the questions raised by the farmers (provide solutions to a farm problem) in distance mode. VASAT technical experts configured a web-enabled Content Management System (CMS), which acted like an information communication tool between the ICRISAT experts and PEWs.

VASAT received the first set of questions (transliterated from Telugu to English) on 1 October 2004 and provided answers on 7 October 2004 (Table 1). The data revealed that the questions were not clear and the ICRISAT experts were forced to seek several clarifications from the PEWs over phone for problem diagnosis. Consequently the whole process was delayed. After analyzing these details, the project team decided to train the PEWs and the VNAs on agro advisory in distant mode. Young experts (who have both IT skills and agricultural knowledge) available with VASAT agreed to spend three days in the villages for providing the informal training on agro-advisory in distant mode.

The details of the training program conducted for three days (19 October to 21 October 2004) are as follows:

**Day One:** The experts advised the PEWs and the VNAs to observe the process of collecting questions from the farmers; sending them to experts; and receiving answers from the experts within 24 hours. In this process, the experts also asked half a

**Figure 2: Information Flow and Linkages in Addakal Mandal (AP, India) as perceived by Rural Women and Men**

1 Content Management System: Web enabled Content Management System provides a virtual kind of school environment. It tracks user activities and helps assess his/her performance. This provides a distance learning methodology to educate the selected rural individuals on drought, agriculture and livestock issues with the help of innovative course modules developed on the basis of analyzed local needs.
dozen questions (on the stage of the crop, prior crop, kind of problem, the period of the plant’s sickness) before receiving a question from the farmers. They explained to the PEWs and the VNAs how this information helped experts to understand the problem.

**Day Two:** On the second day, the experts requested the PEWs and the VNAs to repeat the same procedure of Day One. They made critical observations on the activities of the PEWs and the VNAs. At the end of the day, they shared those observations with the PEWs and the VNAs with the help of a participatory appraisal.

**Day three:** The young experts repeated the same activity.

**Observations**

- Most of the experts were not able to read and write, they were not aware of the details an expert would need to diagnose a problem.
- It was observed, 80% of the questions were related to pest and disease problems (sometimes it reached 100%), 20% are related to information about locally suitable varieties, info of the seed selling offices, water scarcity issues etc.
- The PEWs and the VNAs redirected the same questions to the experts.

**For example:**

**Before training:** ICRISAT experts received a question ‘I observe flower dropping in my castor field, please advice me’ from Shantamma, 35 years old, resident of Vemula.

**Advice of ICRISAT experts:** Need adequate information to understand the problem.

1. ICRISAT experts expected more details to understand the problem before providing the solution, because of their concern for reliability.
2. Most of the ICRISAT experts were not familiar with local terms (localization is a serious issue in agricultural extension, because local names vary from one location to another even within a province. Experts often used scientific names in their discussions).

**After training:** The same question was repeated - ‘In the 3-month old castor crop in my 4-acres land, I have observed two kinds of flowers, red and green; only the red ones turned in to fruit and the green flowers dropped down, please advice me’ from Shantamma, 35 years old, resident of Vemula.

**Advice of ICRISAT experts:** Green flowers were male flowers, after fertilization male flowers dropped down, and the red female flowers turned into fruit. This is natural and there is no need for taking up any measure.

- After the training program, the confidence level of the PEWs and the VNAs has increased and farm communities started receiving solutions within 48 hours.
- The farm community expressed satisfaction with the service available at the VIC.

Satyanarayana Reddy, 45 years old literate but poorly informed farmer, resident of Jaanampeta village, says ‘earlier we used to take the advice from the pesticide shop dealers on random mixing of the pesticides. Now with the help of this service we are able to figure out the accurate dosage. It saves money.’

Chandrabala, 30 years old, a resident of Kommireddypalli village, says ‘we are happy with the service, I brought quino phosphor for a pest problem in my field, and it worked. Earlier, I used to buy mono (monocrotophos), acephate on the advice of pesticide dealer for any problem in my field. I used to get mixed results’

**Lessons learnt**

- There is a need to promote community-based para-extension workers to help rural families combat drought more effectively. ICT mediated extension education alone cannot improve the change the existing agricultural extension system. Human factors also play a critical role in technology adoption. There is a need of trained village workers, who are able to adopt the new technological innovation for bringing considerable changes in the current agriculture extension system for drought preparedness. These knowledge workers act like torchbearers in these drought prone areas.
- ICT4D projects cannot succeed unless the community has a sense of ownership and participation right from the beginning.

**In lieu of a conclusion**

There are ongoing programs by VASAT, on IT literacy, literacy training on agriculture, livestock issues, coping with drought and water scarcity issues in these pilot villages. AWS-VASAT jointly selects these individuals on the basis of their educational qualification (most of the participants are school dropouts who have secondary level education) and involvement in the farm activities. These trained villagers act like mediators between the farmers and the experts. It was observed that the farmers who had irrigation facility were growing the paddy even in drought conditions. After the training program on ‘coping with drought’ (content developed on both in Telugu and English) farmers have expressed their willingness to change their cropping patterns to less water requiring crops such as maize, castor, chickpea, pigeonpea, pearl millet etc.

Right information given at an appropriate time can empower the poor rural communities that struggle to live amidst recurrent droughts. But the process of arriving at what information is ‘right’ and when it needs to be delivered to the communities are very important. It is also necessary to understand how the individuals are seeking information, processing it and disseminating the same to their fellow members in their communities. The present study reinforces the necessity of trained knowledge workers in the villages to bridge the knowledge gap between the research laboratories and the farms. The study also shows that it is possible to build the capacity of the local women and youth to act as para-extension workers who can effectively mediate between experts and their farm communities.
Acknowledgements

We are thankful to COL, ICT-KM for providing financial support during the study period. We had treasured immense assistance, encouragement and incomparable affection from the members of AWS staff; ICRISAT-VASAT staff; villagers of Jaanampeta, Kommireddypalli and Vemula during the tenure of the study.

NEW RELEASE FROM CEMCA/COL

Teleconferencing: A Training Kit

The rapid growth and expansion of telecommunications has made it possible for institutions engaged in distance and open learning contexts to use a variety of delivery strategies. Teleconferencing is one such strategy that is wide acceptance and application worldwide.

This manual, comprising a print version, a CBT and a CD of video clippings is a comprehensive kit structured in such a way as to help the academic, the trainer and the planner in working out the teleconference activities systematically through the entire process. The manual is divided into seven sections, each dealing with a particular aspect from basic information on teleconferencing, its strengths and weaknesses to the importance of monitoring and evaluation and ways to go about it. It not only addresses some of the queries that users face to determine whether or not this is the most effective delivery strategy in reaching target groups, but at the same time, it also assists with the operation of the system in an effective and cost effective manner.

The manual will be soon available on CEMCA website http://www.cemca.org. Copies can also be obtained on request to Director, CEMCA, cemca@nda.vsnl.net.in

* After November VASAT didn’t receive any new questions until February, as rainfed crop season ends by November.

Note: During this period answers provided on ICRISAT mandatory crops only; chickpea, pigeonpea, groundnut, castor, sorghum and pearl millet. The future plan is to provide advisory on all the cultivated crops of this region that include paddy, cotton, vegetable crops and fruit crops; to develop demand driven generic content on more drought related issues.
