## ABSTRACT

In the 1982 International Pearl Millet Downy Mildew Nursery (IPMDNN), 45 entries were evaluated of reactions to downy mildew (DM) by co-operators at 14 locations in India and West Africa. The results were received from 12 locations. Kamboinse in Upper Volta provided the most severe DM pressure followed by ICRISAT Center and Mysore. No entry was DM free at all locations. Three entries — ICH 415, P-433 and P-83 had less than 10 percent DM at all the locations. Other entries that performed well were P-100, P-2830, P-1930, 700512 and 700518 with maximum of 12 percent DM at any location. Two entries — 700661 and 700616 showed consistently high levels of DM resistance in this seventh year of test.

## RESUME

En 1982, les 45 entrées de la Pépinière internationale du mildiou du petit mil (IPMDNN) ont été évaluées par des coopérateurs à 14 points d'essai en Inde et en Afrique de l'Ouest. Les résultats portant sur la réaction au mildiou ont été reçus de 12 emplacements. L'infection de mildiou la plus sévère a été enregistrée à Kamboinse en Haute-Volta suivi du Centre ICRISAT et Mysore. Aucune entrée n'était exempte de mildiou à tous les emplacements. Une incidence inférieure à 10% a été constatée chez trois entrées dont ICH 415, P-433 et P-83. D'autre part, parmi les entrées ayant un bon comportement figurent P-100, P-2830, P-1930, 700512 et 700518 dont l'incidence maximum est de 12%. Deux entrées — 700661 et 700616 — ont manifesté un niveau très élevé de résistance pour la septième année de suite.

INTERNATIONAL PEARL MILLET DOWNTY MILDEW NURSERY  
(IPMDNN)

INTRODUCTION

The International Pearl Millet Disease Resistance Testing Program (IPMDRTP) was initiated in 1976 with the establishment of the International Pearl Millet Downy Mildew Nursery (IPMDNN). The IPMDNN program is an international cooperative activity through which pearl millet cultivars are tested for degree and stability of resistance to downy mildew (DM). The results of the previous years' IPMDNN, which were tested by cooperators at more than 20 locations in six countries in Africa and Asia, indicated major difference between test entries in the level and stability of DM resistance, and between locations in the severity and virulence of the DM pathogen (*Sclerospora graminicola*). As the trial provided valuable information there was considerable support for it to continue. In 1982 the seventh IPMDNN was distributed to cooperators at 10 locations in India and at 5 locations in 4 countries in Africa. At the time of preparation of this report results have been received from 12 locations. The report is being prepared at this time in order that the data and entries may be used in the 1983 main growing season.

TEST LOCATIONS AND COOPERATORS

Details of the test locations and the cooperators from whom data were received by January 31, 1982 are given in Table 1. The locations represent an excellent coverage of Indian and West African millet

growing regions where DM occurs in severe form.

## ENTRIES

The trial contained 45 test entries and cooperators were invited to include a local susceptible check after every 10 test entries to act as "indicator" of local DM pressure. The majority of the 1982 IPMDMN entries were those that had performed well at all locations in the 1981 PRE-IPMDMN, the 13 best entries from the 1981 IPMDMN were also included.

## RESULTS

Three infection parameters were calculated:

- i) Percent infection 30 days after planting (% INF 30)
- ii) Percent infection at final scoring (Incidence)
- iii) A combination of incidence and severity termed infection index (severity)

Detailed results from each location are presented in Tables 2 to 6.

Plant population was more than 30 for all entries at Mysore, Ludhiana, Kovilpatti, Aurangabad and Mioro-de-Rip. At other locations some of the entries had less than 30 plants.

## DM Pressure at Test Locations

**ICRISAT Center:** Five entries -- P-433, P-110, P-460, P-100 and P-965 were DM free and 32 entries developed less than 10 percent DM. BJ-104 developed 54 percent DM and 7042 and NHB-3, the two standard

susceptible checks had 79 and 91 percent DM, respectively. Local susceptible check averaged 96 percent mean DM severity Table 2.

Mysore: Three entries -- P-460, P-93 and ICH-415 were DM free and 27 entries including P-7, 700251 and 700516 developed less than 10 percent DM. NHB-3 and 7042 developed 30 and 47 percent DM, respectively. Local susceptible check developed 57 percent mean DM severity, Table 2.

Ludhiana: Fifteen entries were free and all the remaining entries except 700546 (24% DM) had less than 5 percent DM. 7042 developed only 18 percent DM. Local susceptible check averaged 48 percent DM severity, Table 3.

Jamnagar: Thirty entries were DM free and with the exception of SDN 503 (14% DM) other entries also developed less than 10 percent DM. DM severity on NHB-3 and 7042 was 62 and 56 percent, respectively. Local susceptible check averaged 65 percent DM, Table 3.

Aurangabad: All the test entries except 7042-3-1-2-2-2 (11% DM) were either DM free or had less than 5 percent DM. NHB-3 and 7042 had only 37 and 23 percent DM, respectively. Local susceptible check averaged 51 percent DM, Table 4.

Kamboinse: No entry was DM free and only six entries had less than 10 percent DM. DM severity in the local susceptible check ranged from 17-67 percent with a mean of 35 percent. Entry 7042-3-1-2-2-2 a DM resistant version of standard susceptible check 7042 that showed high levels of DM resistance at all Indian locations, developed heavy DM at Kamboinse (87% DM), Table 4.

Nioro-de-Rip: All the test entries except P-2902, were either free or had less than 10 percent DM severity. As usual, in Senegal, NHB-3 developed exceedingly low DM (2% DM). 7042 and its version that

is resistant in India, were highly susceptible. Local susceptible check showed high DM resistance, Table 5.

**Misaga:** Twenty eight entries were DM free and the majority of the remaining entries had less than 10 percent DM. BJ-104 developed 37 percent DM severity. NHB-3 had 89 percent DM while 7042 surprisingly developed only 9 percent DM. Local susceptible checks averaged 59 percent DM, Table 5.

**Koyilandy:** Eleven entries were DM free and 27 had less than 10 percent DM. BJ-104 developed 58 percent DM at this location. Local susceptible check averaged 73 percent DM severity, Table 6.

**Coimbatore:** All the test entries were either free or had less than 10 percent DM. NHB-3 and 7042 had 36 and 39 percent DM, respectively. Local susceptible check averaged 31 percent DM, Table 6.

Data from Samaru and Pudukkottai are not included due to low plant population and certain other discrepancies.

#### Performance of Entries Across Locations:

Across location performance of entries are presented in Table 7. Entries were ranked on mean DM severity values.

No entry was DM free at all locations. Twenty three entries had less than 5 percent across-location mean DM severities and included 700516 and 700651 which have performed best in all the preceding years' IPMDDN trials. The remaining entries also had less than 10 percent across location mean DM severities except 7042-3-1-2-2-2 (20% DM). The reactions of the five best entries -- SDN-503, P-7, 700251, 700516 and 700651--have been similar to their DM reactions in previous

years, Table 8.

## OTHER DISEASES

Records on natural occurrence (unless otherwise mentioned) of ergot, smut and rust were taken at several locations.

Ergot: Ergot records were taken at Coimbatore, Hissar, ICRISAT, Jamnagar and Kovilpatti. At ICRISAT Center where entries were inoculated artificially, ergot was most severe. No entry showed an acceptable level of resistance. Conversely at Kovilpatti ergot was just in traces on a few entries only. Detailed data for all locations are presented in Table 9.

Smut: Records on smut were taken at Coimbatore, Kovilpatti, ICRISAT, Jamnagar and Hissar. No entry at Kovilpatti and Coimbatore developed smut. Smut was most severe at Hissar followed by Jamnagar where no entry (except 700512 and 700546 at Jamnagar) had less than 12 percent smut. At ICRISAT Center smut pressure was moderate with 20 entries having less than 10 percent smut, Table 10.

Rust: Records on rust incidence were taken at Coimbatore, Jamnagar, ICRISAT and Kovilpatti. Rust pressure was most severe at Coimbatore followed by Kovilpatti and Jamnagar. No entry was rust free at these locations. However maximum rust was not more than 40 percent on any entry at any of these locations. At ICRISAT Center rust pressure was extremely low and the majority of the entries were rust free, Table 11.

Blast: Light incidence of blast on 700651, ICH-105, P-462, IP-1930, IP-2058, EB-83-2 and 7042-3-1-2-2-2 was recorded only at Kovilpatti.

## DISCUSSION

Downy mildew pressure as evidenced by heavy DM severities on the local susceptible checks at the majority of the test locations, has been adequate. Thus the screening of test entries has been effective. Freedom from DM or extremely low levels of DM recorded on many entries at Indian locations are due to their high resistance to DM.

The performance of the five best entries including SDN-503, P-7, 700251, 700516 and 700651 has been consistent over seven years. Slight increases in the DM-severity of P-7, SDN-503 and 700251 at ICRISAT Center over the previous years has been probably due to the inadequate plant population. In addition, performance of IP-193, EB-83-2, MPP-7147-2-1, E-298-2-1-8, 700546, 700512 and SDN-714 has been consistently good (<10% DM severities) over 3-4 years. Thus these are other extremely good sources of stable DM resistance.

The performance of 7042-3-1-2-2-2, a DM resistant version of 7042 selected at the ICRISAT Center, is exciting. It has shown high levels of resistance at all the Indian locations. However, at Kamboinse and Nioro-de-Rip it was highly susceptible. This shows that for resistance developed this way to be stable, it is essential that the process of reselection should be at a location where the pathogen is most aggressive. The reaction of this entry also confirms the differences in the virulence of the DM-pathogen between India and West Africa.

High levels of DM on BJ-104 at ICRISAT Center, Hissar and at Kovilpatti indicate that the resistance in this hybrid is gradually becoming ineffective. It would therefore be appropriate to replace this hybrid by the resistant one or an attempt should be made to

increase its resistance to DM.

#### The 1983 IPMDMN

The IPMDMN will be continued in 1983 with a selection of the best 1982 IPMDMN entries and those lines that performed well in the 1982 PRE-IPMDMN.

#### SEED SUPPLY

Any scientist who would like to receive seed of any entry listed in this report should send a request to the Millet Pathologist at ICRISAT (address given on inside back cover of this report) indicating that the seed request is from the 1982 IPMDMN entries.
